Telescope Array (TA)

- Telescope Array Collaboration was forged by Members of HiRes (High Resolution Fly's Eye) and AGASA
 - Study Ultra High Energy Cosmic Rays (spectrum, composition, anisotropy, ...)
 - Understand the differences between AGASA and HiRes Especially wrt super-GZK events
 - Study the galactic to extra-galactic transition: measure cosmic rays over the second knee, ankle, and GZK with one cross-calibrated detector
- Current collaboration from the US, Japan, Russia (INR RAS), Korea, and Belgium

Combined TA Energy Spectrum

Comparison with other Measurements

TA Composition Results

- Use hybrid or stereo to constrain geometry and know X_{\max}
- Stereo also provides a redundant measurement of X_{\max}

High Energy Hybrid Event

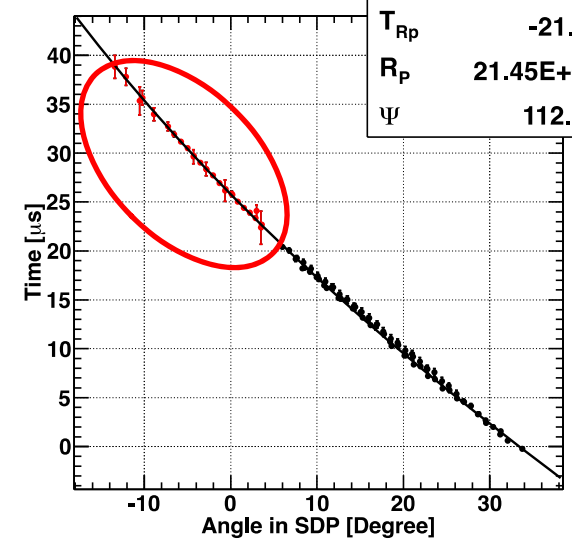

MD-FD 2010/08/12 07:30:33.216258

MD Hybrid : 2010/08/12 07:30:33.216258

Time vs Angle (Hybrid)

χ^2 / ndf	115.13 / 99
T_{Rp}	-21.71
R_{p}	21.45E+03
Ψ	112.82

Shower Profile

$\log_{10}(E)$	20.12
X_{Max}	764.10
N_{Max}	8.44e+10

Energy: 1.3×10^{20} eV
Zenith Angle: 55.7°

Surface array constrains geometry fit via extra timing & core information

Stereo Observation

Intersect shower planes to get more precise geometry

Proton X_{\max} resolution, $E \geq 10^{18.4}$ eV

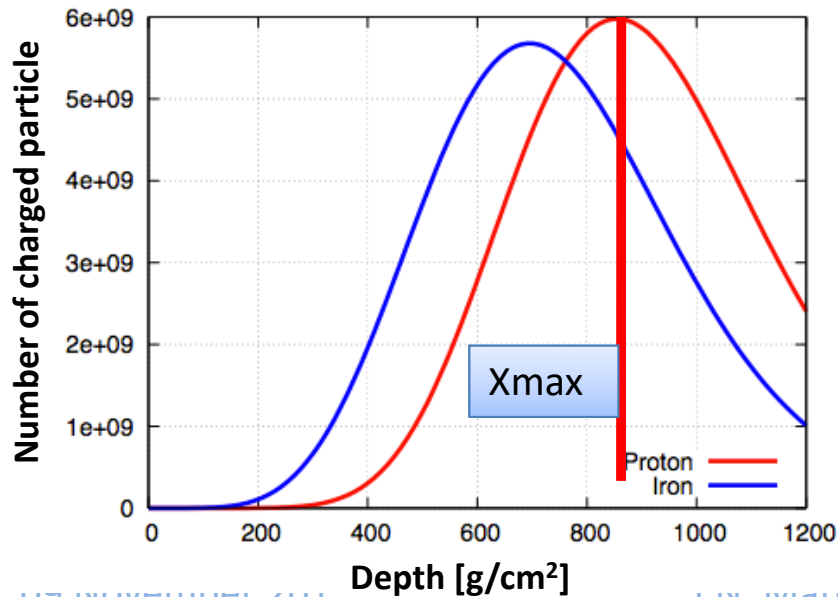

Xmax Technique

- Shower longitudinal development depends on primary particle type.
- FD observes shower development directly.
- Xmax is the most efficient parameter for determining primary particle type.

Shower longitudinal development

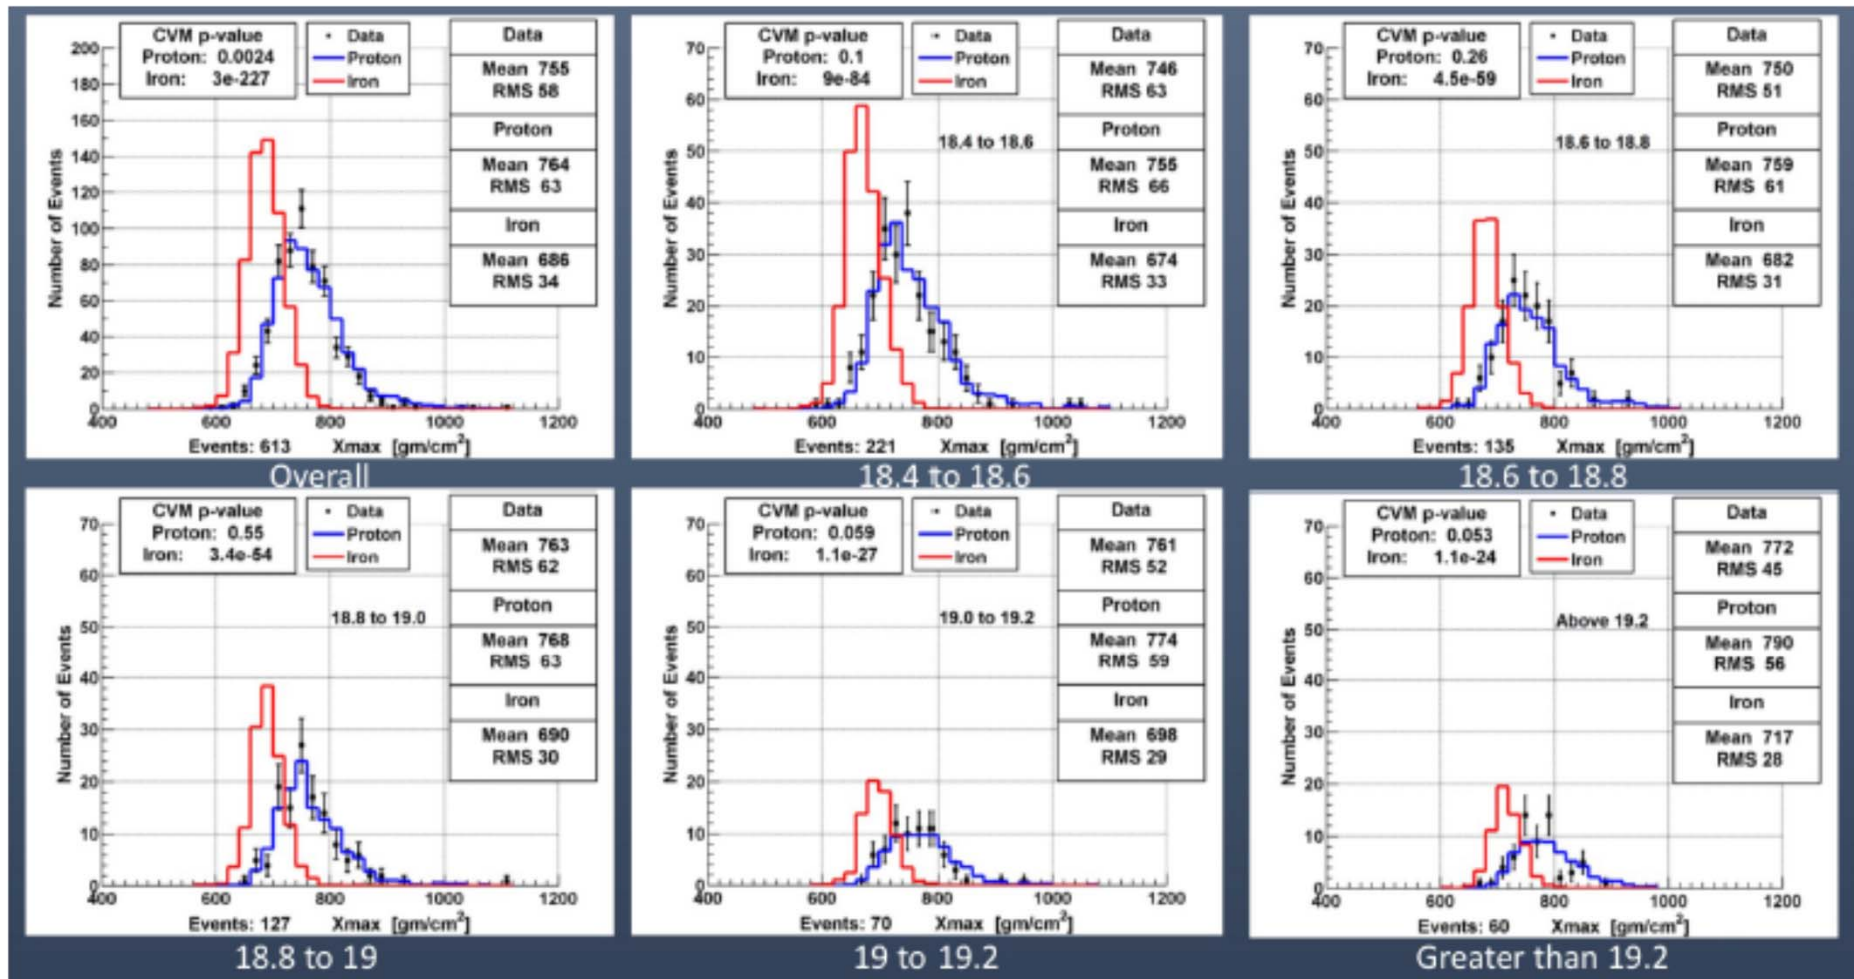

MD Hybrid Observation

- Astropart. Phys. 64 49 (2014).
4 yrs, 297 Events $> 10^{18.4}$ eV
- Cuts based on pattern recognition technique to improve resolutions $s \leq 25$ g/cm², all energies.

7 years of MD FD hybrid data
623 events [$\log_{10}(E/\text{eV}) > 18.4$]
Xmax resolution ~ 22 g/cm²,
reconstruction bias < 2 g/cm²
Energy resolution $\sim 7\%$

Hybrid X_{\max} Measurement

MD X_{\max} Data comparison to QGSjet II-03 **proton** and **iron** models

MD Hybrid

Elongation:
 $\langle X_{max} \rangle$ vs $\log(E)$ plot

“Shift Plot”

Plot ΔX_{max} required to maximize data/MC agreement (QGSJETII-03).

Standard statistical test on shifted distribution (points)

Pink, blue bands for other hadronic models

16 g/cm² systematic uncertainty

Hybrid Data/Monte Carlo X_{\max}

$18.2 < \log_{10}(E/eV) < 18.6$

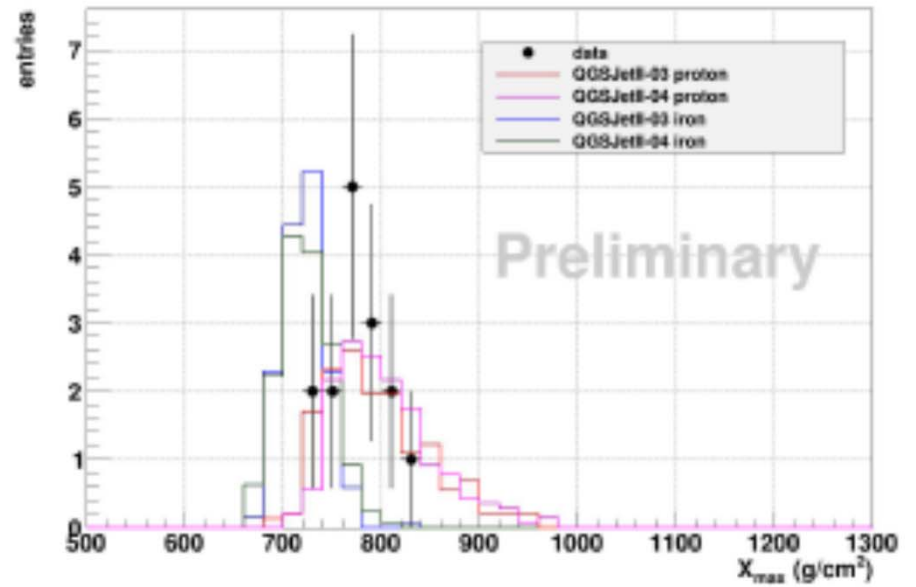

$18.6 < \log_{10}(E/eV) < 19$

Hybrid Data/Monte Carlo X_{\max}

$19 < \log_{10}(E/eV) < 19.4$

$\log_{10}(E/eV) > 19.4$

TA data compared to QGSJet-II.3

Astrophysically p and He are very different

Interaction lengths of p, He, O and Fe

Meta-analysis: Composition WG

TA data cannot distinguish between mix and QGSJETII-3 protons at this level of systematic uncertainty.

TA Measurement of $\sigma_{p\text{-air}}$ (inelast.)

- Extract $\sigma_{p\text{-air}}$ from tail of X_{max} distribution
- Estimate $\sigma_{p\text{-p}}$ (Glauber)

Systematic source	Systematic (mb)
Model Dependence	± 17
20% Helium	$+18$
Gamma < 1%*	-23
Total	(+25, -29)

Photon search

Photon-induced showers:
 arrive younger
 contain less muons
 ⇒ multiple SD observables affected:
 front curvature, Area-over-peak, # of FADC
 signal peaks, $\chi^2/\text{d.o.f.}$

$$45^\circ < \theta < 60^\circ$$

Neutrino search

► Neutrino produces very inclined young shower

young shower, $\theta = 19.5^\circ$

long, indented waveforms

old shower, 78.3°

one peak

**No young inclined showers in the dataset
→ no neutrino candidates.**

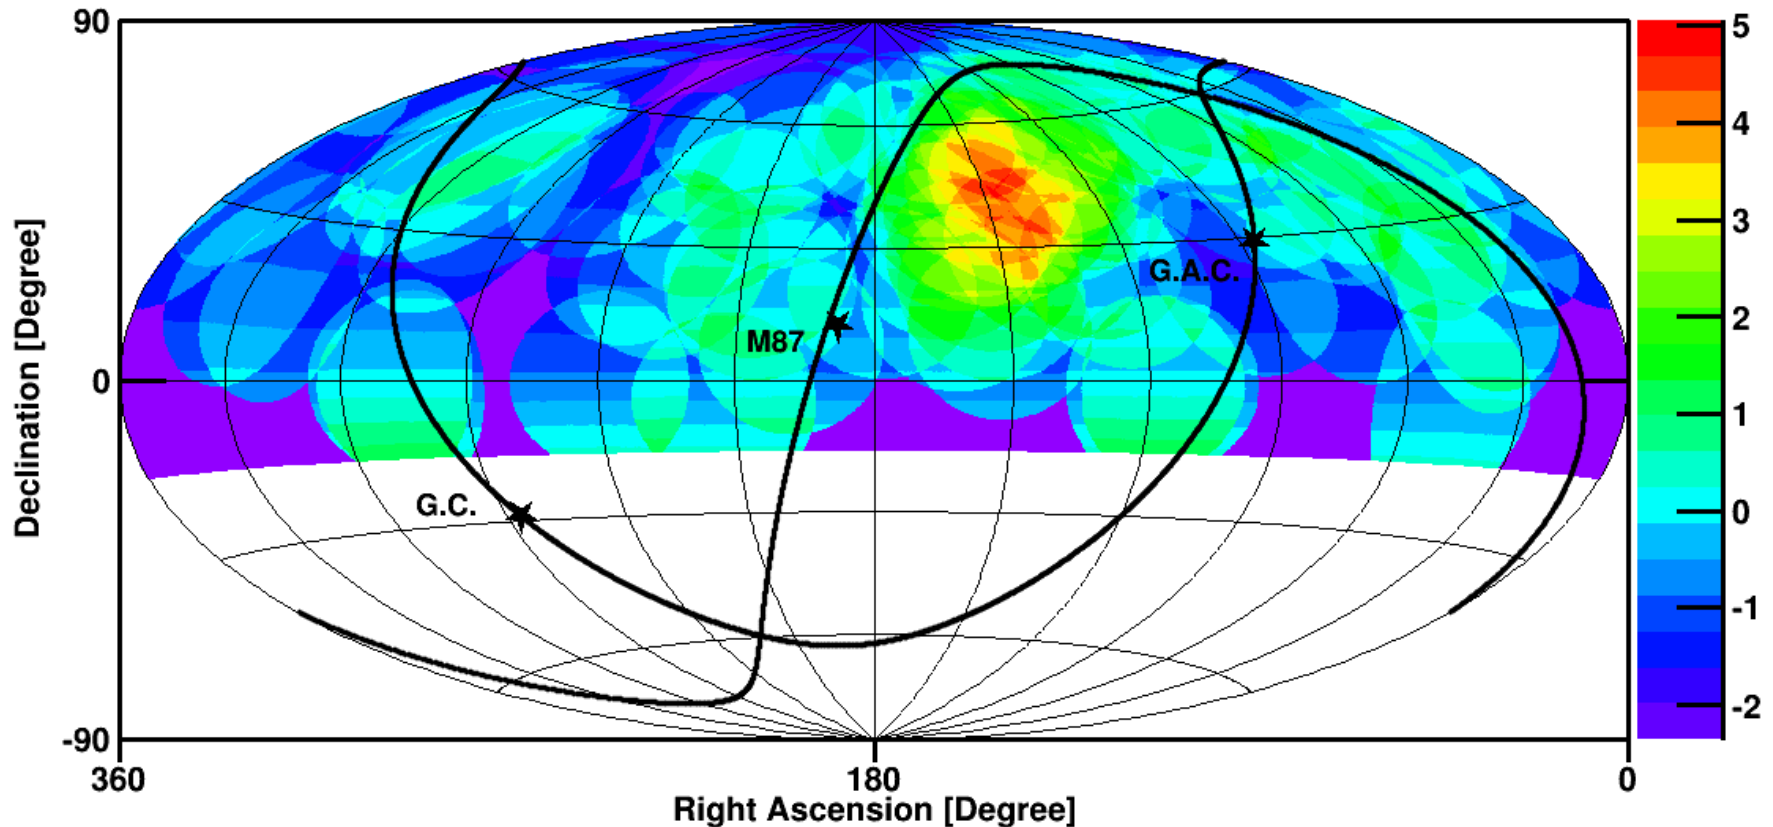

TA Anisotropy Results

Anisotropy Analysis

- SD data from period **12.05.2008 — 11.05.2015 (full 7 years)**
- Zenith angle up to 55° , loose border cut
- Geometrical acceptance; exposure 8600 km² yr sr
- **2996** above **10 EeV**
- **210** above **40 EeV**
- **83** above **57 EeV**
- Angular resolution: better than 1.5°
- Energy resolution: 20%

Published Hotspot (5yr data)

$E > 5.7 \times 10^{19}$ eV (72 events)

Aitoff projection in Equatorial Coordinates

Events over-sampled using 20° circles

19/72 events fall in hotspot (RA,dec) \sim (146.7°,43.2°)

4.5 events expected (26% of events in 6% of the area)

LiMa significance: 5.2σ Estimate 3.4σ chance probability

Hot Spot update: 7 years

First 5-year data (72 events) -- ApJ 790 L21 (2014)

New 2-year data (37 events)

Total (2008 May 11 – 2015 May 11) 109 events

	Period	Total	Signal	B.G.	Chance Prob.
	6-th Year	15	3	0.94	7%
	7-th Year	22	1	1.37	74%
	6th + 7th	37	4	2.31	20%

Fermilab

7 Year Excess Map

Max significance 5.1σ ($N_{\text{SIG}} = 24$, $N_{\text{BG}} = 6.88$) for 7 years

Centered at R.A.= 148.4° , Dec.= 44.5° (shifted from SGP by 17°)

Global Excess Chance Probability: 3.7×10^{-4} : 3.4σ (\sim same as first 5 years)

Consistent with Fluctuation

K.S. Test shows data is consistent with fluctuation for hotspot
(Poisson: average = 3.43 per year, no time variation),

BUT, inconsistent with chance excess from isotropic distribution (Poisson: average = 0.9 per year) at $\sim 2.6\sigma$

TA + PAO All Sky

No correction for
Energy scale difference
b/w TA and PAO !!

TA : 7 years 109 events ($>57\text{EeV}$)

PAO : 10 years 157 events ($>57\text{EeV}$)

Oversampling with 20° -radius circle

Southern hotspot is seen at Cen A (Pre-trial $\sim 3.6\sigma$)

Fermilab

Nearby Galaxy Clusters

Dots : 2MASS catalog Heliocentric velocity < 3000 km/s ($D < \sim 45$ Mpc) *Huchra, et al, ApJ, (2012)*

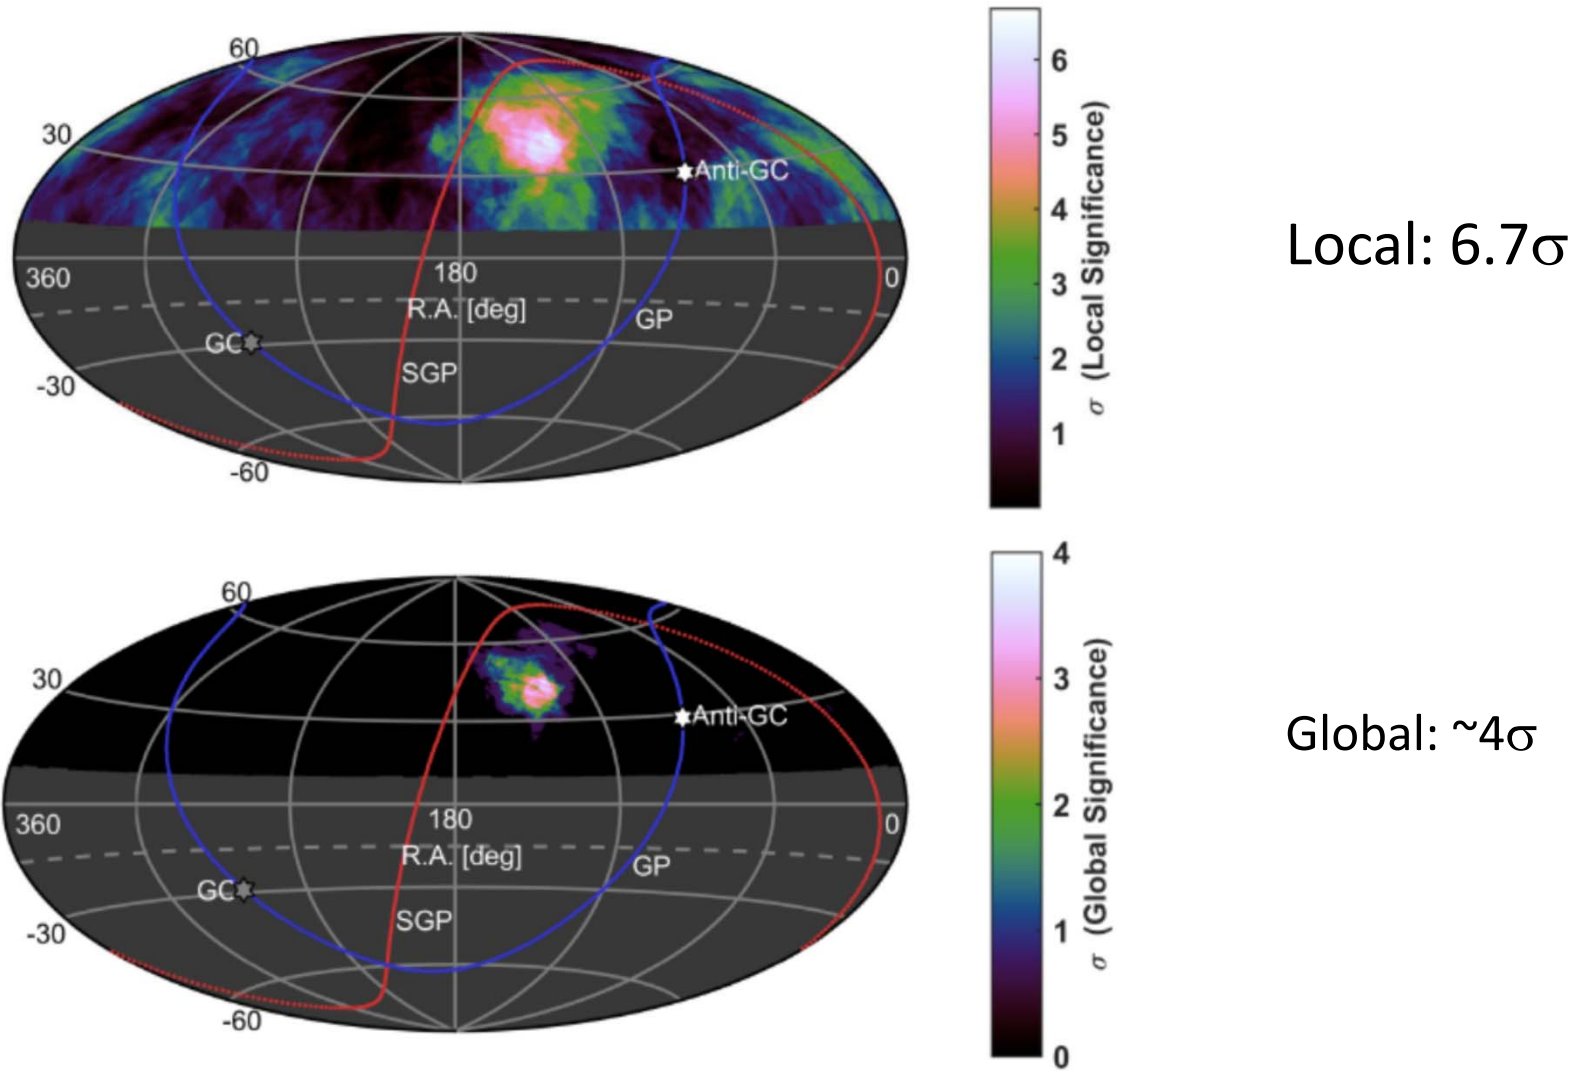

TA hotspot is found near the Ursa Major Cluster
TA & PAO see no excess in the direction of Virgo.

Anisotropy in the Energy Spectrum

Spectral differences “on” and “off” of the Hot Spot

Anisotropy in Energy Spectrum

Correlation with Large-Scale Structure (LSS)

Equatorial coordinates. Darker color represents larger flux.
UM — Ursa Major; Co — Coma; V — Virgo; PP — Perseus-Pisces

Gray patterns:
expected flux density
from proton ($E=57$
EeV) LSS 2MASS
Galaxy Redshift
catalog (XSCz)

LSS Correlation (continued)

1D Kolmogorov-Smirnov p values comparing expected flux distribution (gray map from previous page) vs. simulation:

Marginally Incompatible with isotropic source simulation

Compatible with LSS source simulation

Cannot distinguish between LSS and isotropic simulations for $E > 10 \text{ EeV}$ and $E > 40 \text{ EeV}$ distributions

Autocorrelation

For each angular bin:

1. Count number of pairs of events at in the bin at separation δ
2. Chance Probability is given by the fraction of isotropic MC sets (with equal statistics) with as many or more than the number of pairs seen in data

Compatible with isotropy at $E > 10$ EeV and $E > 40$ EeV,
Tension with isotropy at $E > 57$ EeV

In Related News:

- Discussion of energy scale revealed outstanding issues including missing energy and energy dependence of the fluorescence yield
- Previous FLASH thin target: high energy (28.5 GeV) and thin sampling chamber (1.7cm): 30% missing energy
- FLASH thick target: relative measurement (shower profile), no absolute measurement
- AirFly: 120 GeV beam in Nitrogen, relies on 337nm, two other experiments to get from N to air
- MacFly: measured relative yield as a function of radiation length of Cu target using 50 GeV low intensity slow spill proton beam. Measured relative yield. Absolute yield had large systematic errors (+/- 23%)

Shower max energy range not well covered by experiments

10 GeV Air Shower MC

$E_{\text{ave}} = 23.9 \text{ MeV}$, FWHM: 2-250 MeV

Revisit Fluorescence Yield

Basic idea of SLAC T-542: sFLASH

- Deposit $E_{EM} \sim 10^{18}$ eV (10^9 e in a pico-second bunch @ 10-15 GeV) into air-equivalent material (Alumina). Shower develops in 0 – 3 r.l. of Alumina (Al_2O_3)
- Measure the air fluorescence photons after the shower exits into air (3 m of air to beam dump) – Particle energies similar to those around shower maximum
- Fluorescence yield of 10^{18} eV electromagnetic shower near shower maximum in air

sFLASH Experiment Setup

sFLASH In Real Life:

End Station A at SLAC

S-band Horn Antenna

PMTs

Window (1x1.2m)
& Shutter

Beam Pipe

ICT: Integrating
Charge Transformer

sFLASH

- Picosecond beam pulses at SLAC means very large signals are possible. ESA geometry allows shower to develop in meters of air (corrections for delta rays minimized compared to thin chambers)
- Proof of concept in July
- Short run in Sept.
- Improved design to control FOV
- Add shielding (scattering from beam dump) greatly improved S/N (3->30)
- Currently calibrating and looking at data
- First pass puts us in the ball park, now need to beat down the error bars
- Goal is <10% uncertainty in absolute yield

The Future of TA

TA_{×4} Project

Quadruple TA SD (~3000 km²)

500 scintillator SDs

2.08 km spacing

Approved in Japan 2015

3 yrs construction, first 100 SDs have arrived in Utah (2016-05), second shipment is being prepared

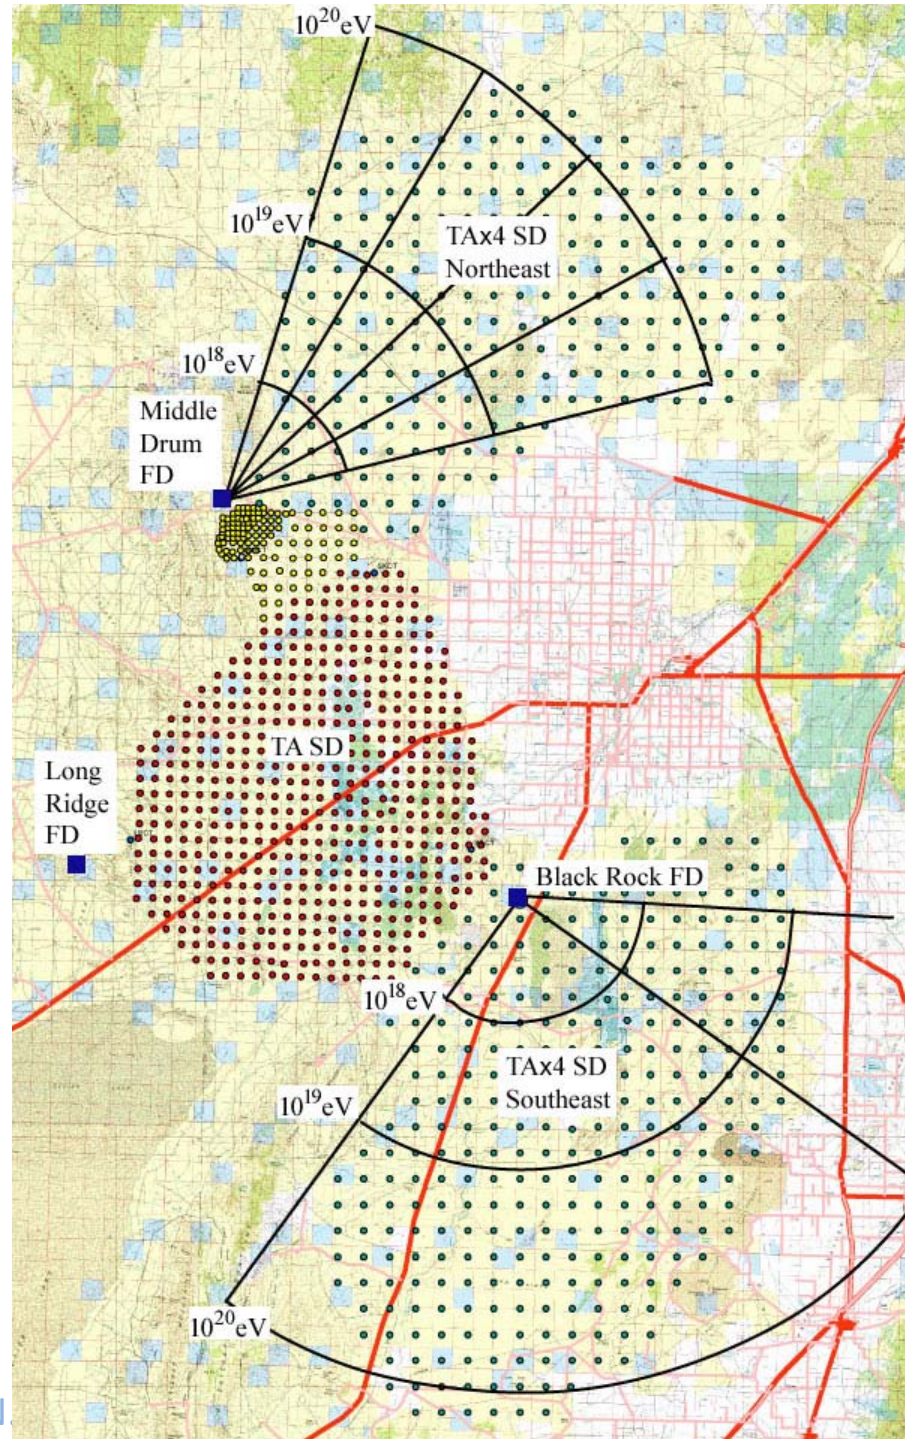

2 FD stations (12 HiRes Telescopes)

Funding approved US summer 2016

Get 19 TA-equiv years of SD data by 2020

Get 16.3 (current) TA years of hybrid data

09 November 2016

J.N

Clarify the details of the Hotspot

Simulated 19 TA-equiv yrs data

(1) One Hotspot

Hotspot Signal
 80-18.9=61 events
 (RA, Dec)=(145°, 45°)
 Gaussian $\sigma=10^\circ$

Isotropic B.G.
 305-61=244 events

Oversampling
 20° radius circle

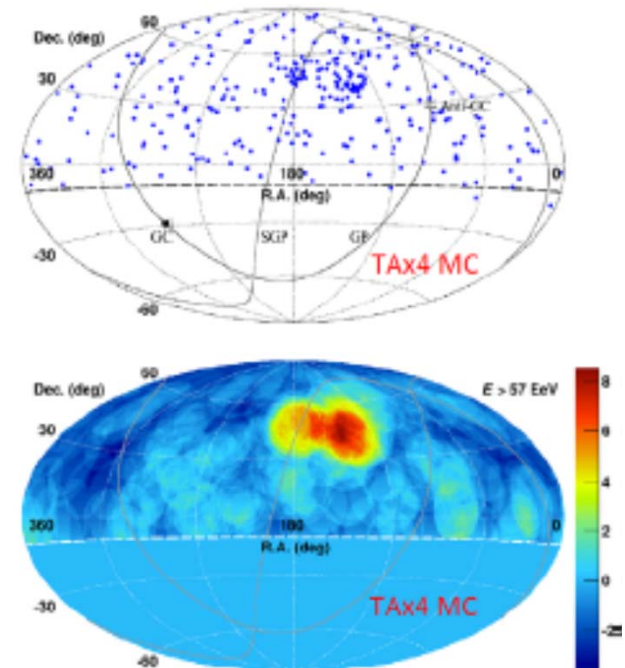

Single Source

(2) Double Hotspot

Hotspot Signal
 Total 61 events
 1. 41 events
 (RA, Dec)=(145°, 40°)
 Gaussian $\sigma=10^\circ$
 2. 20 events
 (RA, Dec)=(175°, 40°)
 Gaussian $\sigma=5^\circ$

Isotropic B.G.
 305-61=244 events

Oversampling
 15° radius circle

Two Separated Sources

Summary

- TA has measured the energy spectrum, composition and arrival direction of UHE cosmic rays
- The spectrum and composition of UHE cosmic rays measured by TA remain compatible with a light component at above the ankle ($\sim 6 \times 10^{18}$ eV).
- We have reported a hot spot seen in the direction of Ursa Major
- Hints of anisotropy are beginning to emerge, but nothing conclusive
- **New:** TA Low Energy Extension (TALE) is coming on line.
- TA and TALE have measured energy spectrum between 6×10^{15} eV to over 10^{20} eV with a single cross-calibrated set of detectors and have observed spectral features
- **Much more data are needed! – coming soon TAx4**

A deeper understanding of the X_{max} systematics will help close the gap in the measurements at the highest energies

Fermilab

Ursa Major Supercluster

Krause et al.,
A&A, 551, 143 (2013)

[http://
www.atlasoftheuniver
se.com/galgrps/
vir.html](http://www.atlasoftheuniverse.com/galgrps/vir.html)

Solid curve : SGP
Point: galaxy group

The angular distance between the hotspot center and the supergalactic plane is estimated to be 19° . The Ursa Major supercluster is extended by more than $\pm 10^\circ$ from the supergalactic plane. We therefore cannot rule out some relationship between the hotspot and this supercluster.

Mrk421? Filament to local cluster ?

Comparison to Previous Attempts

- Previous incarnation a thick target for FLASH measured relative air fluorescence as a function of rad. Length with 28 GeV electron beam. No absolute measurement. Shower measured in small air gap, 2.5 cm thick chamber
- MacFly measured relative yield as a function of radiation length of Cu target using 50 GeV low intensity slow spill proton beam. Measured relative yield. Absolute yield had large systematic errors (+/- 23%)
- Picosecond beam pulses at SLAC means very large signals are possible. ESA geometry allows shower to develop in meters of air (corrections for delta rays minimized compared to thin chambers)

Galactic to Extra-Galactic Transition

- Previous suspected structure
- Unknown energy scale
- Tie down the energy scale and simultaneously measure spectrum and composition
