

# Artificial Intelligence at Fermilab

Aleksandra Ciprijanovic - SCD  
Research Associate

53<sup>rd</sup> Annual Users Meeting  
10-13 August 2020.

## “Defining the Decade” - Artificial Intelligence

There are two major reasons for AI boom in the last decade:

Computing Power

Data Availability

2010

2014

2018

2019

2011

IBM - Watson

2015

TensorFlow

2016

2020

# AI capabilities and focus areas

Uncertainty quantification  
Learning on graphs

Coprocessors for fast inference  
Distributed training

Self operating telescopes  
Experiment controls

hls4ml and FPGAs  
ASIC codesign

# Fermilab - long AI history

*Fermi*News  
November 18, 1988 Vol. XI, No. 21 Fermi National Accelerator Laboratory

## Neural Network Startup

In the past few years, there has been a tremendous resurgence in research on neural networks, the name given to arrays of single-bit, quasi-digital processors whose high level of interconnectivity resembles that of nerve cells in the brain. Neural nets seem to be good at problems that humans solve easily, but that conventional computers are notoriously bad at, such as pattern recognition and decision making based on incomplete or faulty data.

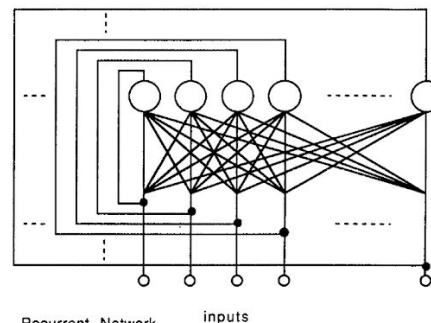

Bruce Denby, who has recently joined the Lab as a Wilson Fellow based in the Computing Department, is beginning a project to explore the possibility of using artificial neural networks and other fine-grained SIMD architecture devices in experimental triggers or offline pattern recognition engines.

Networks implemented in VLSI have demonstrated enormous speedups over conventional microprocessors for certain applications. Also, because of the high redundancy in the interconnection network, neural sets are relatively insensitive to localized faults caused by point defects in silicon substrate or by errors in the data input.

Persons wishing to find out more about neural networks should contact Bruce Denby at FNAL::DENBY or drop a note to him at MS 120. If there is sufficient interest, regular discussion sessions can be set up.

# The AI Initiative

Accelerators

Neutrinos

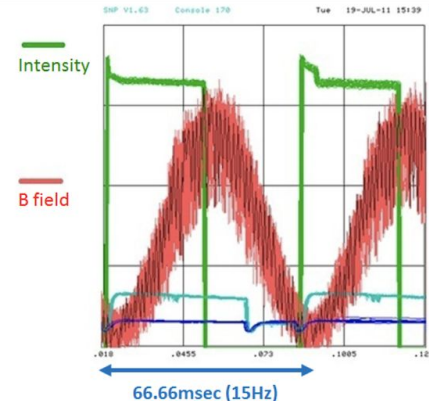

Astronomy

Quantum Science

# AI for Accelerator Control

- **Goal** - reduce beam losses in the Booster.
- **Approach** - using a reinforcement learning algorithm on a custom FPGA board to control the gradient magnet power supplies (GMPS).
- **The scope** - single crate control system (one board with back-up), but the project lays the foundation for a more ambitious future program.
- **Achievements so far:**
  - Significant progress in adopting **hls4ml** tools to Intel chipsets (optimizing resource allocation on the FPGA).
  - Proof-of-principle “agent” trained a reproduction of the current (accelerator domain expert-built) system using a surrogate model trained using historical data from the accelerator complex.

# Quantum Computing for ML

- QML is the **use of quantum resources for machine learning problems.**
- Studying quantum algorithms for object classification in astronomy.
- **Goals** - hardware co-design, building up the software stack, characterizing the performance of modern hardware, etc.
  - Lockheed Martin: “Studying the use of quantum annealers for machine learning”
  - <https://arxiv.org/abs/1911.06259>

FERMILAB-PUB-19-546-QIS-SCD

Restricted Boltzmann Machines for galaxy morphology classification with a quantum annealer

João Caldeira,<sup>1</sup> Joshua Job,<sup>2</sup> Steven H. Adachi,<sup>2</sup> Brian Nord,<sup>1,3,4</sup> and Gabriel N. Perdue<sup>1</sup>

<sup>4</sup>Department of Astronomy and Astrophysics, University of Chicago, Chicago, IL 60637

(Dated: February 17, 2020)

- Alphabet X (with U. Waterloo): studying gate-based (“universal”) quantum kernel methods using QC built by Google (their supremacy chip)

- *Funded through DOE QuantISED*

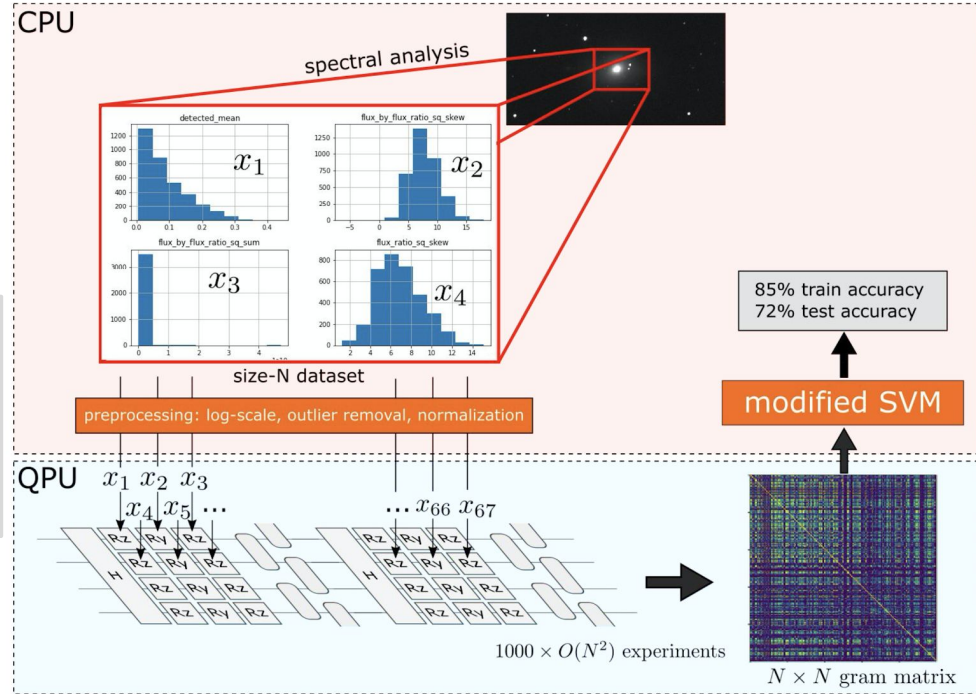

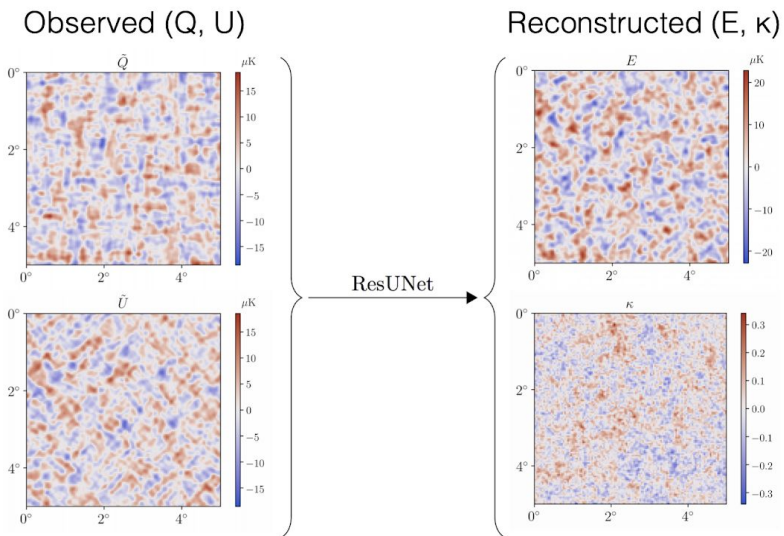

Figure by E. Peters (Waterloo)

# AI for Astronomy

Noise and other foregrounds obfuscate primordial GW signatures  
Pioneered use of **Residual UNets** to separate lensing signals ( $\kappa$ ) from CMB polarization map ( $E$ )

Caldeira et al. 2019, Astronomy & Computing, 28, 100307

Many projects, joint with several other institutions  
(UChicago, ORNL, UMichigan, Argonne):

- **ML helping study astronomical objects in the big data era** (large surveys - DES, SDSS, LSST, SPT etc.) - strong lens finding and measuring; galaxy mergers: classification and domain adaptation; CMB lensing; galaxy-cluster-finding; solar flare classification; Extrasolar planets.
- **ML helping automation**: self-driving telescope; artifact classification in DECam images.
- **ML and uncertainty quantification** in astronomy.

# AI for CMS

Pixar

ACM Trans. Graph 36 (2017) 97

CMS

- Detector simulation w/ Geant4 is accurate but computationally intensive.
- Tune parameters for faster, but less accurate output.
- Use Denoising CNN to restore output quality.

Target: 1 color = energy deposited (normalized:  $c' = (c - \mu_c) / \sigma_c$ )  
 CNN: 9 layers, 100 features/layer  
 Patch-based  $l_1$  loss function

- Event reconstruction using Graph NNs:  
[arXiv:1801.07829](https://arxiv.org/abs/1801.07829)  
[arXiv:2003.11603](https://arxiv.org/abs/2003.11603)  
[arXiv:1902.07987](https://arxiv.org/abs/1902.07987)

# AI for Neutrinos

- ML for faster workflow and enhanced event reconstruction.
- A publication is being prepared: “GPU-accelerated machine learning inference as a service for accelerator neutrino experiment computing”.
- In the future implement the process of FPGAs.

# Other activities

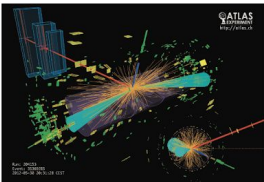

- First community event - AI Jamboree
- Collected 20+ AI “flyers” on ideas
- Hands on ML tutorials

- AI seminar series
- Webpage redesign

**FPGAs at the point of data collection enable ultrafast data processing with minimal computational resources.**

The CMS experiment generates data far too quickly for traditional computers to handle. Turbo boosting special circuits, called Field Programmable Gate Arrays (FPGAs), **instantly decide what data are interesting enough** to keep and which can be safely discarded.

**Researchers develop AI algorithms to improve their analysis of particle collisions at the ATLAS experiment.**

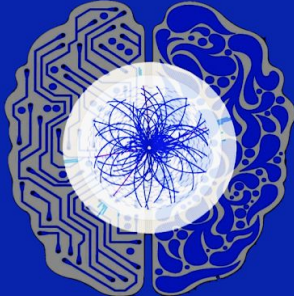

Particle physicists have devised new AI techniques to help them classify the mass of complex data generated by the ATLAS experiment at the Large Hadron Collider. **They train their algorithms to ignore unreliable information.** This work has connections to any endeavor involving extreme data environments.

## Fermilab AI Jamboree!

February 13, 2020

Wilson Hall, Curia II  1:00PM - 4:30PM

*Agenda:*  
**Overview of AI & HEP  
Example applications  
Panel Q&A  
Idea Incubator**

**LEARN MORE**  
Find out about the connections between HEP & AI and a few on-going applications across Fermilab

**Local Organization:**  
Aisha Ibrahim  
Kyle Hazelwood  
Burt Holzman  
Marco Mambelli  
Brian Nord  
Bill Pellico  
Gabriel Perdue  
Jason St. John  
Nhan Tran

**IDEA INCUBATOR**  
Stick around for coffee and snacks, and share your AI work or discuss your interesting applications with experts and enthusiasts by making an AI flyer!

**Learn more and register at**  
[indico.fnal.gov/event/23008](https://indico.fnal.gov/event/23008)

*Jamboree in conjunction with PI week (Feb. 17 - Feb. 21)*

# Thank you!

Home in SCD but involves  
**all science groups**

**Collaboration** with  
other labs

**Cross-cutting** new  
technologies

**Real-time AI** - fast triggering, fast  
control, nanosecond scale inference

AI on **ASICs** and FPGA

Working with **huge datasets**

**Discovery science**

**Theory and new algorithms**
